Abstract of the Disclosure

A system and method employing a processing node having storage capabilities for facilitating service creation and negotiation in a wireless network, by associating user information and/or service information with network information. User information, service information, and network information are provided periodically and dynamically into the storage. Using the processing node, user information and/or service information are associated with network information without having to access various network elements located throughout the network, to facilitate service creation and negotiation, and thus minimize network processing and network resources.
